

BURWEED MARSH ELDER (GIANT POVERTY)

Genus/species	<i>Cyclachaena xanthiifolia</i>	
Synonyms	Common: Giant Sumpweed Botanical: <i>Iva xanthiifolia</i>	
Family	Asteraceae	
Distribution	Central, W and NE US	E Washington southward to NE California NE California southeastward to N Texas N Texas northeastward to central Illinois Central Illinois northwestward to E Washington New Jersey to Maine
Comments	This species is a common plant along roadsides, cultivated fields or along streams in much of the central part of the US. It may grow to be 6 feet tall. The species name refers to the shape of the larger leaves, which are rather triangular or fan-shaped, resembling those of the Cocklebur. The undersides of the leaves are lighter in color than the upper surfaces. Young plants of Burweed Marsh Elder may resemble sunflower plants at a similar stage of development (and often grow in similar habitats), but the rather inconspicuous greenish flowers of the mature Marsh Elder depend upon wind-pollination.
